

[Download ISPProtect BanDaemon 12 Months](#)

ISPProtect BanDaemon is a software to protect your server against brute force or DoS attacks. The ISPProtect BanDaemon watches your server log files e.g. apache/nginx, pureftpd, and recognizes hacking attempts. It uses iptables and iptables to block the attacking IP addresses or subnets. Currently, the ban daemon is best suited to protect servers that have ISPConfig installed. It monitors log files of pureftpd, ssh, postfix, dovecot, apache/nginx, ISPConfig login, and bind. In addition, it supports some web software e.g. wordpress, xmlrpc, attack, pingback, attack, or brute force login, owncloud, and Joomla. The daemon can be easily extended to watch further log files and react on specific log entries to ban IP addresses. The license is valid for months on one server.
